SECTION I GENERAL DESCRIPTION

1-1 GENERAL

Hewlett-Packard AC-4 series Decade Counters count negative pulses. The AC-4C, AC-4E, and AC-4G indicate the count by lighting a number in a column of numerals; the AC-4J, AC-4K, and AC-4L use a single digital display tube to indicate the count.

The decade counters produce one output pulse for every ten input pulses. The output pulse is generated when the units step from 9 to 0. Thus any count storage capacity may be obtained by connecting the units in series and placing them side by side so that the first unit provides the "units"

digit, the second unit provides the "tens" digit, etc. The total count appears as a number across the row of counters.

All AC-4 series Decade Counters provide a staircase voltage output, which may be used to program the Φ Model 560A Digital Recorder. The AC-4J, AC-4K and AC-4L also provide a ten-line code output, which may be used to program the Φ Model 561B Digital Recorder, or operate a remote readout units with digital display tubes.

On special order, a four-line binary coded decimal (1-2-2-4) output is available on any Decade Counter unit.

Figure 1-1. AC-4 Decade Counters

SECTION II INSTALLATION

2-1 GENERAL

This section contains installation information of the AC-4 series Decade Counter units. The Decade Counter units in Φ electronic counters and digital voltmeters are installed at the factory and are ready to operate. Table 2-1 shows the arrangement of Decade Counter units in Φ electronic counters. When Decade Counter units are used for other application refer to figures 4-15 and 4-16 for mounting dimensions.

2-2 ELECTRICAL CONNECTIONS

The pins of base plug P1 of the Decade Counter units are listed below with their connections:

- Pin 1 Heater. Pins 1 and 7 receive heater power. Either may be grounded.
- Pin 2 + 300 volts. This voltage need not be regulated unless staircase is used. Transients or rippled must be less than 20 volts peak for AC-4G, and AC-4K; less than 10 volts peak for AC-4E, and AC-4J.

Table 2-1. Decade Counters used in Φ Electronic Counters

524C	AC-4K	AC-4K	AC-4K	AC-4K	AC-4K	AC-4K	AC-4J	-----
524D	AC-4G	AC-4G	AC-4G	AC-4G	AC-4G	AC-4G	AC-4E	-----

* For counters having 220 kc option, the unit counter is replaced by AC-4C or AC-4L.

- Pin 3 Signal input. Input impedance, AC-4E, and AC-4J: Approximately 4.7K in series with 47 pf. Input impedance, AC-4G, and AC-4K: Approximately 15K in series with 100 pf. Input impedance, AC-4C and AC-4L: 11K in series with 200 pf.
- Pin 4 Staircase output. Load does not affect counting of units, but may lower staircase voltages. With regulated +300 volts supply applied to pin 2, the staircase voltage levels are as follows: Approximately +135 volts at the count of "0" and approximately +55 volts at the count of "9". Source impedance is approximately 700,000 ohms.
- Pin 5 Reset to "0". Must be grounded through resistance not more than 750 ohms.
- Pin 6 Ground.
- Pin 7 Heater. See pin 1.
- Pin 8 Readout voltage for digital display tube. For reliable readout, apply $230 \text{ v} \pm 5\% \text{ v}$. To blank readout, apply less than +100v.
- Pin 9 No connection.
- Pin 10 No connection.
- Pin 11 No connection.
- Pin 12 Output signal. Maximum load, AC-4E, and AC-4J: 150,000 ohms or 15,000 ohms in series with 100 pf. Maximum load, AC-4C, AC-4G, AC-4K, and AC-4L: 300,000 ohms or 6,000 ohms in series with 100 pf. Note: When the output signal is not used to drive another decade counter unit, connect a 47 pf capacitor to pin 12 of base socket and ground.

2-3 TEN-LINE CODE CONNECTION

Models AC-4J, AC-4K, and AC-4L Decade Counters have a second base plug P2, which supplies ten-line code information. Pins 1 through 9 of base plug P2 are connected to numerals 1 through 9 of the digital display tube. Pin 10 of P2 is connected to the numeral 0. Ten-line code information should be taken with respect to +115 volts reference bus (pin 11 of P2). The external load connected between the reference bus and any numeral output should be no less than 200,000 ohms and preferably at least 500,000 ohms. Loads should not be connected between the numeral output and ground. An approximate output waveform of ten-line code output is shown in figure 2-1.

2-4 4-LINE BINARY-CODED-DECIMAL (1-2-2-4) OUTPUT

The 4-line binary-coded-decimal (BCD) output is obtained by adding four 1-megohm resistors to the decade counter unit. The resistor is connected

Figure 2-1. Output waveform of 10-line code

from the output plate of each binary to a pin of the base plug. The numerals, 1, 2, 2, and 4, which define the BCD code specify the weights assigned to each of the four output plates. When the output section is conducting steadily, the output plate is in "0" state (low plate voltage). When the output section is cut-off, the plate is in "1" state (high plate voltage).

Upon completion of a count the four output sections in the decade counter unit have a unique combination of low and high plate voltages. The decimal equivalent is found by adding the weights of the output plates which are in "1" state. For example, if all output sections are in "1" state, the decimal equivalent is 9 (1 + 2 + 2 + 4). Zero is obtained when all four output sections are in "0" state. The following table shows the state of each output section and its plate voltage of decade counter unit.

Table 2-2. (1-2-2-4) Output

	First Binary (V1)	Second Binary (V2)	Third Binary (V3)	Fourth Binary (V4)
Decimal Count	Binary Weighting			
	1	2	2	4
	State of Binary

0 state	+62V	+53V	+53V	+53V
1 state	+172V	+135V	+135V	+135V
AC-4E and AC-4J				
0 state	+52V	+52	+52	+52
1 state	+145V	+137V	+137V	+137V
Source impedance of BCD output is approx. 1 meg.				

SECTION III

CIRCUIT DESCRIPTION

3-1 GENERAL

The decade counter units consist of four bi-stable multivibrators (binaries) and a bank of ten neon lamps. The sum of the voltages from three binary halves is applied to each neon lamp. After any number of input pulses, only one of the ten possible sums is large enough to light its lamp. In the AC-4C, AC-4E, and AC-4G, the neon lamps are behind a numbered mask, and the lighted lamp illuminates the number of the mask which corresponds to the number stored in the positions of the four binaries. In the AC-4J, AC-4K, and AC-4L, the lighted lamp illuminates a particular one of ten photoconductors. The photoconductor, when illuminated, lights the number in a digital display tube corresponding to the number stored in the position of the four binaries.

Figure 3-1. Block Diagram

The first binary determines whether an odd or even number is lighted; the remaining three binaries determine which odd or which even number is lighted.

The four binaries are connected in cascade so the output from the first is fed to the input of the second, and so on. Each binary responds only to negative pulses and, as shown in Figure 3-1, produces alternately positive-going and negative-going wavefronts. These wavefronts become pulses when differentiated by the coupling capacitors and the circuit resistances. Thus each binary divides its input frequency by two.

With four such binaries, one negative output pulse would result from every 16 negative input pulses. However, two feedback loops add 6 extra counts for each 10 input pulses, providing a division ratio of 10:1 instead of 16:1.

Figure 3 - 1 shows how the feedback reduces the overall division from 16 to 10 and how the neon lamps are lighted.

3-2 BINARY

Binaries used in the decade counter units are shown in Figures 3-2 and 3-3. These binaries have two stable states. In one state, section A conducts and section B is cut off. In the second state, section A is cut off and section B conducts.

Consider the binary in Figure 3-2. If section B is conducting the voltages are as shown in the figure. Note that the charge on C2 is much larger than the charge on C3. An 80-volt negative pulse, differentiated by C1 and the circuit resistance, is applied to the common plate load. The pulse cuts off section B and drives the plate potential of section A down near that of section B. The plate potential of section B is not affected much because it is already low. As the pulse decays, the plates and grids of both sections become more positive. However, the grid of section A is more positive than the grid of section B because of the unequal charges

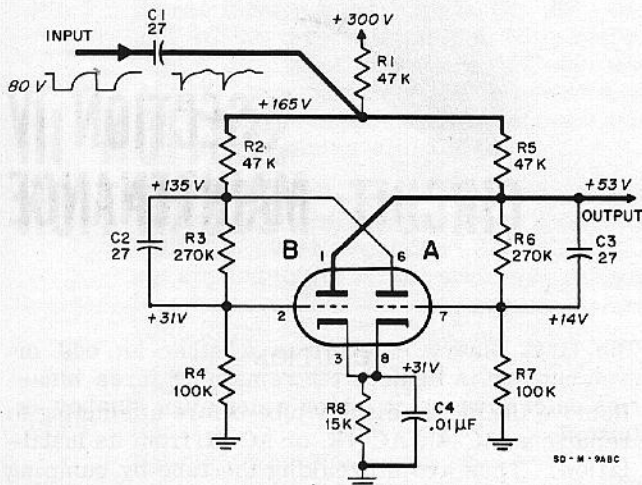

Figure 3-2. Low-Frequency Binary

of C2 and C3. Therefore, section A starts to conduct first and holds section B cut off. In this condition, C3 has more charge than C2. Thus, the next negative pulse flips the binary back to the first condition. A positive pulse will not trigger the binary.

Consider the binary of Figure 3-3. If section B is conducting, the voltages are as shown in the figure. Note that CR1 has no bias and that CR2 has reverse bias. The differentiated negative pulse, which has

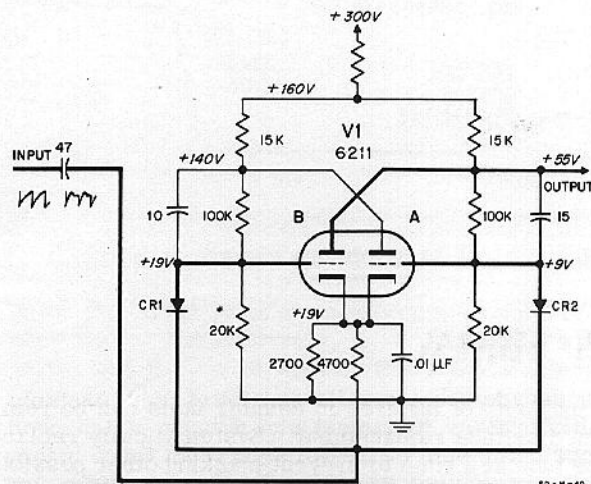

Figure 3-3. High-Frequency Binary

an amplitude of only 5 to 10 volts, reaches only the grid of section B, through CR1. Reverse bias keeps CR2 open. The pulse is amplified and inverted in the plate of section B. The positive signal on the plate of section B brings section A into conduction, and the resulting negative signal on the plate of section A drives section B to cut-off. In this condition, CR1 has reverse bias and CR2 has none. Thus, the next negative pulse will flip the binary back to the first condition. A positive pulse will not trigger the binary.

SECTION IV MAINTENANCE

4-1 GENERAL

A majority of failures in counter units can be remedied by tube replacement. Systematically replace one tube at a time to prevent masking other possible circuit failures. If you replace a tube without improving the operation, return the original tube to its socket.

You may exchange any counter unit with a like unit without adjustment or change in operation; therefore, to determine if a counter is faulty, replace it with one known to be operating properly. When exchanging units in this manner, keep in mind that a defective unit can upset the operation of cascaded units that follow. If several units seem to operate improperly, service the first faulty one, that is, the one operating at the highest speed.

CAUTION

Remove the digital display tube before attempting to remove an AC-4J, AC-4K, or AC-4L from its installation. Thus avoid breaking the tube by bumping it against a panel, another unit, etc. when the unit comes free from its socket.

4-2 CHECKING AN INDIVIDUAL COUNTER UNIT AT LOW SPEED

You can analyze some failures by applying pulses at a very low rate and observing the counting sequence that results. Figure 4-1 shows a circuit which will apply a reliable pulse for low-speed operation of the counter units.

Figure 4-1. Triggering Circuit

If the counting sequence is incorrect, but the unit still has ten stable indications for ten pulses applied, first check the lamp connections and the printed wiring for short circuits; then check for a defective lamp which does not light with the normal applied voltage.

If the counter has 12 or 16 stable states, one or both of the feedback networks is defective.

The following chart shows some incorrect indications obtained when making a low-speed operational check and gives the circuit most likely to be at fault.

Table 4-1. Troubleshooting Chart

Resets to	Counting Cycle	Faulty Circuit
0	0, 1, 8, 9, (AC-4G, AC-4H and AC-4K then repeat 6, 7, 8, 9)	V3
0	0, 2, 4, 6, 8	V1
0	0, 1, 2, 3, 4, 5	V4 or output circuit grounded
0	0, 1, 2, 3	V3
0	0, 1, 2, 3, 4 & 0, 5 & 1, 4, 5, 6, 7, 8, 9	Feedback between V2 and V3
0	0, 1, 2, 3, 4, 5, 6, 7, 8 & 2, 9 & 3, 8, 9	Feedback between V4 and V3
0	0, 1, 2, 3, 4 & 0, 5 & 1, 4, 5, 6, 7, 8 & 2, 9 & 3, 6, 7, 8, 9	Both feedback loops
1	Will not count	V1
2	2, 3	V4 or V2
4	4, 5	V2 or V3
6	6, 7, 8 & 2, 9 & 3, 8, 9	V4

4-3 CHECKING AN INDIVIDUAL COUNTER UNIT AT HIGH SPEED

Some kinds of circuit failures can cause counter units to count incorrectly at high counting rates only. Analyze these troubles by observing waveforms throughout the circuit. Use a high-speed oscilloscope such as the 50150A. Begin by measuring the output of the first binary and proceed with each succeeding binary. Adjust the input signal frequency just below and above the frequency where the counting failure occurs and observe the difference in the waveforms. Typical waveforms taken at the plate of each binary are shown in Figures 4-3 and 4-4.

As shown in Figures 4-3 and 4-4, the waveforms deteriorate near the upper frequency limit of the counter units. Faulty capacitors or leakage between conductors on the printed circuit board can cause deterioration at lower frequencies.

Diodes having low back resistance can cause erratic counting by AC-4E, and AC-4J units at low frequencies, yet the units will operate normally at high frequencies. To detect a faulty diode, set the line voltage to 102 V and carefully observe each plate waveform with the unit counting correctly. Negative pips like those shown in Figure 4-2, indicate a faulty diode. Generally, the pips will not be as large as shown in the figures.

Figure 4-2. Negative Pips Indicating a Poor Diode in the Trigger Circuit of the 2nd Binary of an AC-4E, or AC-4J.

Figure 4-3. Waveforms from an AC-4E, or AC-4J. Amplitude calibration 20 volts/cm for input waveforms, 50 volts/cm for plate waveforms.

Figure 4-4. Waveforms from an AC-4G, H, or K. Amplitude calibration 50 volts/cm unless otherwise noted.

SERVICING ETCHED CIRCUIT BOARDS

Excessive heat or pressure can lift the copper strip from the board. Avoid damage by using a low power soldering iron (50 watts maximum) and following these instructions. Copper that lifts off the board should be cemented in place with a quick drying acetate base cement having good electrical insulating properties.

Use only high quality rosin core solder when repairing etched circuit boards. **NEVER USE PASTE FLUX.** After soldering, clean off any excess flux and coat the repaired area with a high quality electrical varnish or lacquer.

A break in the copper should be repaired by soldering a short length of tinned copper wire across the break.

When replacing tube sockets it will be necessary to lift each pin slightly, working around the socket several times until it is free.

1. Apply heat sparingly to lead of part to be replaced. Remove part from card as iron heats the lead.

2. Using a small awl, carefully clean inside of hole left by old part.

3. Bend clean tinned leads on new part and carefully insert through holes on board.

4. Hold part against board and solder leads. Avoid overheating the board.

REPLACEABLE PARTS

5-1 INTRODUCTION

This section contains information for ordering replacement parts for the AC-4 series Decade Counter plug-in units.

Tables 5-1 through 5-3 list replaceable parts in alpha-numerical order of their reference designators. Detailed information on a part used more than once in the plug-in unit is listed opposite the first reference designator applying to the part. Parts descriptions are arranged as follows:

Table 5-1. Models AC-4C and AC-4L

Table 5-2. Models AC-4E and AC-4J

Table 5-3. Models AC-4G and AC-4K

Each table includes the following information:

- 1) Reference designator.
- 2) Full description of the part.
- 3) Manufacturer of the part in a five-digit code; see list of manufacturers in appendix.
- 4) Hewlett-Packard stock number.
- 5) Total quantity used in the plug-in unit (TQ col).
- 6) Recommended spare quantity of one plug-in unit for complete maintenance during one year of isolated service (RS col).

5-2 ORDERING INFORMATION

To order a replacement part, address order or inquiry either to your authorized Hewlett-Packard sales representative or to

CUSTOMER SERVICE

Hewlett-Packard Company
395 Page Mill Road
Palo Alto, California

or, in Western Europe, to

Hewlett-Packard S. A.
Rue du Vieux Billard No. 1
Geneva, Switzerland

Specify the following information for each part:

- 1) Model and complete serial number of instrument.
- 2) Hewlett-Packard stock number.
- 3) Circuit reference designator.
- 4) Description.

To order a part not listed in the tables, give a complete description of the part and include its function and location.

APPENDIX **CODE LIST OF MANUFACTURERS (Sheet 1 of 2)**

The following code numbers are from the Federal Supply Code for Manufacturers Cataloging Handbooks H4-1 (Name to Code) and H4-2 (Code to Name) and their latest supplements. The date of revision and the date of the supplements used appear at the bottom of each page. Alphabetical codes have been arbitrarily assigned to suppliers not appearing in the H4 handbooks.

CODE NO.	MANUFACTURER	ADDRESS	CODE NO.	MANUFACTURER	ADDRESS	CODE NO.	MANUFACTURER	ADDRESS
00334	Humidial Co.	Colton, Calif.	08717	Sloan Company	Burbank, Calif.	66346	Wollensak Optical Co.	Rochester, N.Y.
00335	Westrex Corp.	New York, N.Y.	08718	Cannon Electric Co.	Phoenix, Ariz.	70119	Advance Electric and Relay Co.	Burbank, Calif.
00373	Garlock Packing Co., Electronic Products Div.	Camden, N.J.	08792	CBS Electronics Semiconductor Operations, Div. of C.B.S. Inc.	Lowell, Mass.	70276	Allen Mfg. Co.	Hartford, Conn.
00656	Aerovox Corp.	New Bedford, Mass.	09134	Texas Capacitor Co.	Houston, Texas	70309	Allied Control Co., Inc.	New York, N.Y.
00779	Amp, Inc.	Harrisburg, Pa.	09250	Electro Assemblies, Inc.	Chicago, Ill.	70485	Atlantic India Rubber Works, Inc.	Chicago, Ill.
00781	Aircraft Radio Corp.	Boonton, N.J.	09569	Mallory Battery Co. of Canada, Ltd.	Toronto, Ontario, Canada	70563	Amperite Co., Inc.	New York, N.Y.
00853	Sangamo Electric Co., Cap. Div.	Marion, Ill.	10411	Ti-Tal, Inc.	Berkeley, Calif.	70903	Belden Mfg. Co.	Chicago, Ill.
00866	Goe Engineering Co.	Los Angeles, Calif.	10646	Carborundum Co.	Niagara Falls, N.Y.	70998	Bird Electronic Corp.	Cleveland, Ohio
00891	Carl E. Holmes Corp.	Los Angeles, Calif.	11236	CTS of Berne, Inc.	Berne, Ind.	71002	Birnbach Radio Co.	New York, N.Y.

83298	Bendix Corp., Red Bank Div.	Red Bank, N.J.						

THE FOLLOWING H-P VENDORS HAVE NO NUMBER ASSIGNED IN THE LATEST SUPPLEMENT TO THE FEDERAL SUPPLY CODE FOR MANUFACTURERS HANDBOOK.

From: F.S.C. Handbook Supplements
H4-1 Dated Oct. 1960
H4-2 Dated Oct. 1960

00015-11
Revised: 2 June 1961

WARRANTY

All our products are warranted against defects in materials and workmanship for one year from the date of shipment. Our obligation is limited to repairing or replacing products (except tubes) which prove to be defective during the warranty period. We are not liable for consequential damages.

For assistance of any kind, including help with instruments under warranty, contact your authorized  Sales Representative for instructions. Give full details of the difficulty and include the instrument model and serial numbers. Service data or shipping instructions will be promptly sent to you. There will be no charge for repair of instruments under warranty, *except transportation charges*. Estimates of charges for non-warranty or other service work will always be supplied, if requested, before work begins.

CLAIM FOR DAMAGE IN SHIPMENT

Your instrument should be inspected and tested as soon as it is received. The instrument is insured for safe delivery. If the instrument is damaged in any way or fails to operate properly, file a claim with the carrier or, if insured separately, with the insurance company.

SHIPPING

On receipt of shipping instructions, forward the instrument prepaid to the destination indicated. You may use the original shipping carton or any strong container. Wrap the instrument in heavy paper or a plastic bag and surround it with three or four inches of shock-absorbing material to cushion it firmly and prevent movement inside the container.

GENERAL

Your authorized  Sales Representative is ready to assist you in any situation, and you are always welcome to get directly in touch with Hewlett-Packard service departments:

CUSTOMER SERVICE

Hewlett-Packard Company
